Live Web Buzz:

Doc Searls:
‘the live web’
Search: static web

- Google was created for the static web
  - Pagerank is a function of people's interest on one site, in another site, as expressed in links.
  - Google’s genius was equating those links to social gestures that had value.
  - Key word search returns the 'most relevant' results based upon whomever has the most pagerank.
Search for ‘mary hodder’ in Google

Yields:
- ‘napsterization’
- ‘biplog’
- ‘speaking engagements’
- ‘bloqx’
- ‘hodder.org’
Search for ‘napsterization’ in Google

Yields:

- ‘mary hodder’
- The napsterization blog itself
- Uses of the word, napsterization
Search for ‘mary hodder’ or napsterization in blog search

- Yields key word matches
  - Reverse chron order
- Link search: yields all those who have linked to url
  - Reverse chron order
  - Can resort by Authority in some services
Static webpage search

- **Static Webpages**: Example webpage from a bank.
  - Incoming links 'define the bank' referring to it as an entity, but the bank doesn't change it’s pages.
  - Outgoing links from bank site rarely change.
  - Don’t really want sites like that to update a lot; useful in static nature.
Why do we care about live web search?

- Marketing reasons: blog creators more likely to be:
  - Men: 57% are male
  - Young: 48% are under age 30
  - Broadband users: 70% have broadband at home
  - Internet veterans: 82% have been online for six years or more
  - Relatively well off financially: 42% live in households earning over $50,000
  - Well educated: 39% have college or graduate degrees
- They have characteristics of “opinion leaders”
- Their influence online is growing

Source: Pew Internet & American Life Project, May 2, 2005
Live webpages: what and how

- **Live web pages**: rapidly updated pages such as Flickr photo sets, or blogs, often with lots of links and references in new posts.

- The constant activity produces many more outbound links and references, and many more inbound links, as conversations between creators appear in threads.
  - Old blog entries scroll down and off blogs, but in Google sees them all as subpages.
  - Page rank makes no distinction because it defines pages as 'any page' instead of 'top pages' as technorati, or pubsub do when they 'age' things out of the system.
Metrics of Blog Search

Examples of those who rely on link counts:
- Technorati
- Pubsub
- Bloglines

“authority” vs. “influence”
Live Web Examples

Bloglines: 880,456,867 Articles Indexed
Blogpulse: 18,447,338 feeds
Feedster: 18,047,721 feeds
Ice Rocket: no info
Pubsub: 18,549,449 sources, 11.8m active
Technorati: 21.5m blogs indexed

Del.icio.us: tags, urls and people feeds
Flickr: Photos, tags and sets/groups by 1.5m people

* As of 11/21/05
The Blogosphere: what are you searching?

Let’s estimate: 20 million blogs total
Link metrics used to weigh bloggers

- **Pubsub**: Linkrank based on internal calculation of worth based on inbound links and those linkranks of those who link
- **Technorati**: count of all inbound link sources for last 6 months
- **Bloglines**: count of all links for all time
Subscription metrics

- **Bloglines**
  - Must subscribe to feed to see subscription numbers

- **Feedburner**
  - Must run your feed through Feedburner
  - Subscription numbers only available to feed owner

- **Example: Boing Boing** as of August, 2005
  - In Bloglines, 26,856 subscribers
  - In Feedburner, 1.2 million subscribers to
  - Difference: Feedburner shows all subscriptions
    where as Bloglines shows just those who use
    Bloglines reader and subscribe
Possible other metrics

- Inbound links: to post url
- Inbound links: to blog url
- Comments to posts
- Ratios within topic/post
- Blog server
- Subscribers to RSS feeds and blogs
- Incoming Traffic Links
- Outbound blogroll
- Tagged urls
Search results

- Returned in reverse chron order
- Technorati: can reorder by authority (defined as inbound link count)
- Sphere: can order by date or by relevance (metric based on links and key word analysis)
Results of mixing live web with Google:

- **Google:** has lack of awareness of time about publishing of site
  - **Good:** information continues to be available
  - **Bad:** liveness is lost

- Awareness of links and activity

- **Result:** Live web activity can overwhelm static web
Example: ‘Jerry Reynolds’

- Spammer from 1990’s
  - Largest Usenet spammer in 1997
  - Owner of two sites: netzilla and sexzilla
  - His spam helped, with other spam, to kill Usenet over several years
  - Spam fighters tried to stop it but failed

- Wants this information removed
  - Using C&Ds to remove this documentation from Google

- Why? Google owns Usenet postings.. They come up in searches
Before blogging about Jerry Reynolds

- 13 pages back in Google Results
- Unknown for years by anyone in technology journalism
  - Exception: one article in local paper in North Dakota
Blogging of Jerry Reynolds

-BoingBoing
-Splatterings
-Memeblog

FORER SPANKING JERRY REYNOLDS (OF FARGO, ND) FILES SLAPP SUITS TRYING TO SQUASH THE FREE SPEECH OF PEOPLE EXPOSING HIS SPANNY WAYS

In the "No way, this can't be happening in America" department, we have good citizens David Rite and Ed Falk being sued for saying the truth about Jerry Reynolds being a spammer on a consent basis over 6 years ago.

You can download a copy of all the legal docs here.

Here's how Mary Hodder explains it.

Reynolds has even gone so far as to subpoena Rite and Falk's computers and yet a gag order on sex, but the other one is out of jurisdiction (see note in North Dakota, though Falk lives and does business in CA).

Today, Ed Falk has to give a copy of all his computer harddrives to lawyers, who are still fighting over the jurisdiction issue. I think though that if this case went before a judge in CA, it would immediately be dismissed. All the evidence shows Reynolds was the
Post Blogging: #1 hit on Google
Google and Splogs

- Blogger
- Adsense
- Incentives to change?
What’s needed

(Blog search is at the state of static web search in 1997)

- Sophisticated interfaces
- Topic browsing
- Sophisticated weighting tools
- Static web search adjustments
What’s coming

- ‘Data web’ verses ‘file web’
  - iTags: iname + tag + object = floating data

- Better search
  - Based on better live information
  - Based on data web?
